Man

Contents

Man

Using the man ioslave you are able to read the man pages installed on your system. It is easy to use:

man :

See the sections of the manual, click to find the rest.

man :/ fopen

See the man page of **fopen**.

man :/ fopen (3)

See the man page of **fopen** in section 3.

man :/ (3)

See the index of section 3.

man :/ intro (3)

See the introduction of section 3.

NOTE

If there are more than one man page of the name that you have entered, you will get a list where you can choose the man page that you want to see.

There is also a shortcut: **#fopen**, which has the same effect as above.

If you do not find all your man pages, adjust the configuration file `/etc/manpath.config` (or a file of a similar name depending on your distribution) or adjust the environment variables `MANPATH` and `MANSECT`.

As with any other KDE ioslave, it is possible to enter a URL, like **man :/socket** in *any* KDE application. Try it in KWrite and you will see the man page in HTML format.
