zstd

zstd is a compression program.

The `zstd` KIO worker is not directly usable, and is intended for use as a filter. For example, the `tar` KIO worker can filter a file through the `zstd` KIO worker, in order to display the contents of a `tar.zst` file directly in a Konqueror window.

If you click on a file compressed with a `zst` extension in Konqueror, this KIO worker is used to uncompress it and display it as a normal (uncompressed) file.

If you are a developer, and would like to use the `zstd` filter, you can find documentation on using KIO workers at <http://techbase.kde.org>

See the manual: [zstd](#).
